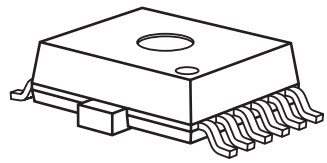
Product Summary

The BTS 5234L is a dual channel high-side power switch in P-DSO-12-2 package providing embedded protective functions.

The power transistor is built by a N-channel vertical power MOSFET with charge pump. The device is monolithically integrated in Smart SIPMOS technology.

P-DSO-12-2



Operating voltage	$V_{bb(on)}$	4.5 .. 28 V
Over voltage protection	$V_{bb(AZ)}$	41 V
On-State resistance	$R_{DS(ON)}$	60 mΩ
Nominal load current (one channel active)	$I_{L(nom)}$	3.5 A
Current limitation	$I_{L(LIM)}$	23 A
Current limitation repetitive	$I_{L(SCr)}$	6 A
Standby current for whole device with load	$I_{bb(OFF)}$	2.5 µA

Basic Features

- Very low standby current
- 3.3 V and 5 V compatible logic pins
- Improved electromagnetic compatibility (EMC)
- Stable behavior at under voltage
- Logic ground independent from load ground
- Secure load turn-off while logic ground disconnected
- Optimized inverse current capability

Type	Ordering Code	Package
BTS 5234L	Q67060-S6155	P-DSO-12-2

Protective Functions

- Reverse battery protection without external components
- Short circuit protection
- Overload protection
- Multi-step current limitation
- Thermal shutdown with restart
- Thermal restart at reduced current limitation
- Over voltage protection without external resistor
- Loss of ground protection
- Electrostatic discharge protection (ESD)

Diagnostic Functions

- Enhanced IntelliSense signal for each channel
- Enable function for diagnosis pins (IS1 and IS2)
- Proportional load current sense signal by current source
- High accuracy of current sense signal at wide load current range
- Open load detection in ON-state by load current sense
- Open load detection in OFF-state by voltage source
- Feedback on over temperature and current limitation in ON-state

Applications

- µC compatible high-side power switch with diagnostic feedback for 12 V grounded loads
- All types of resistive, inductive and capacitive loads
- Suitable for loads with high inrush currents, so as lamps
- Suitable for loads with low currents, so as LEDs
- Replaces electromechanical relays, fuses and discrete circuits

1 Overview

The BTS 5234L is a dual channel high-side power switch (two times 60 mΩ) in P-DSO-12-2 power package providing embedded protective functions.

The Enhanced IntelliSense pins IS1 and IS2 provide a sophisticated diagnostic feedback signal including current sense function and open load in off state. The diagnosis signals can be switched on and off by the sense enable pin SEN.

An integrated ground resistor as well as integrated resistors at each input pin (IN1, IN2, SEN) reduce external components to a minimum.

The power transistor is built by a N-channel vertical power MOSFET with charge pump. The inputs are ground referenced CMOS compatible. The device is monolithically integrated in Smart SIPMOS technology.

1) R and L describe the complete circuit impedance including line, contact and generator impedances

2) Load Dump is specified in ISO 7636, R_I is the internal resistance of the Load Dump pulse generator

3) Current limitation is a protection feature. Operation in current limitation is considered as “outside” normal operating range. Protection features are not designed for continuous repetitive operation.

4) Pulse shape represents inductive switch off: $I_L(t) = I_L(0) * (1 - t / t_{peak})$; $0 < t < t_{peak}$

5) Device mounted on PCB (50 mm x 50 mm x 1.5mm epoxy, FR4) with 6 cm^2 copper heatsinking area (one layer, 70 µm thick) for V_{bb} connection. PCB is vertical without blown air.

4 Block Description and Electrical Characteristics

4.1 Power Stages

The power stages are built by a N-channel vertical power MOSFET (DMOS) with charge pump.

4.1.1 Output On-State Resistance

The on-state resistance $R_{DS(ON)}$ depends on the supply voltage as well as the junction temperature T_j. **Figure 4** shows that dependencies for the typical on-state resistance. The behavior in reverse polarity mode is described in **Section 4.2.2**.

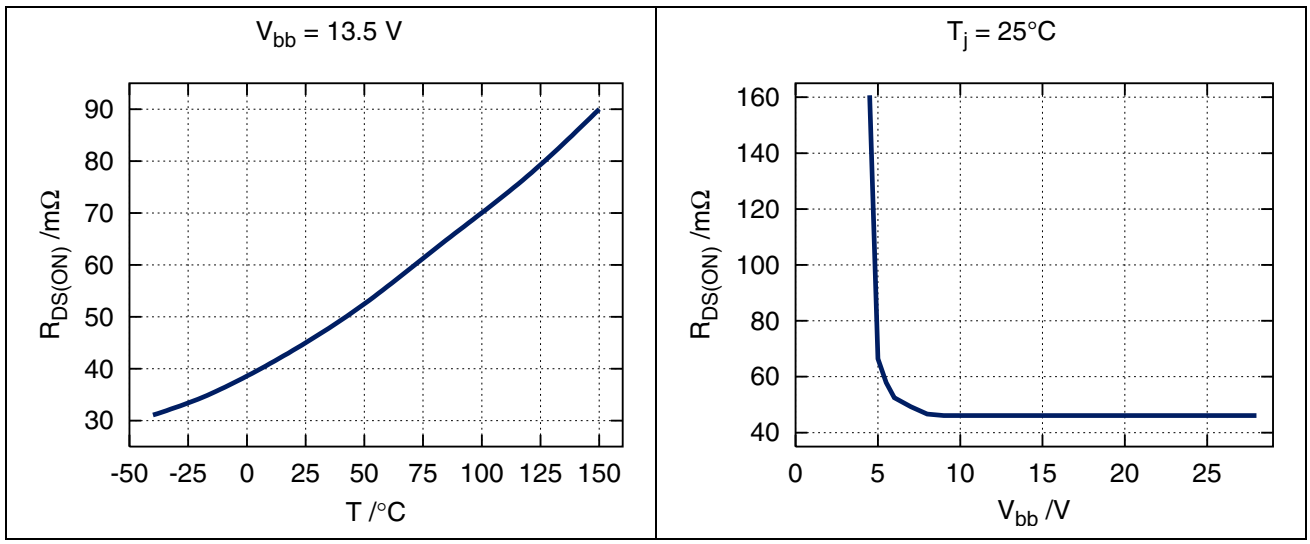

Figure 4 Typical On-State Resistance

4.1.2 Input Circuit

Figure 5 shows the input circuit of the BTS 5234L. There is an integrated input resistor that makes external components obsolete. The current sink to ground ensures that the device switches off in case of open input pin. The zener diode protects the input circuit against ESD pulses.

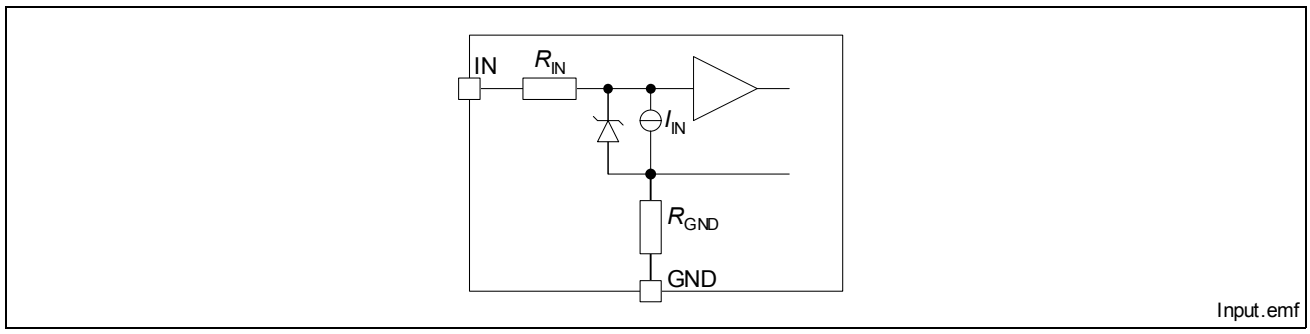

Figure 5 Input Circuit (IN1 and IN2)

A high signal at the input pin causes the power DMOS to switch on with a dedicated slope, which is optimized in terms of EMC emission.

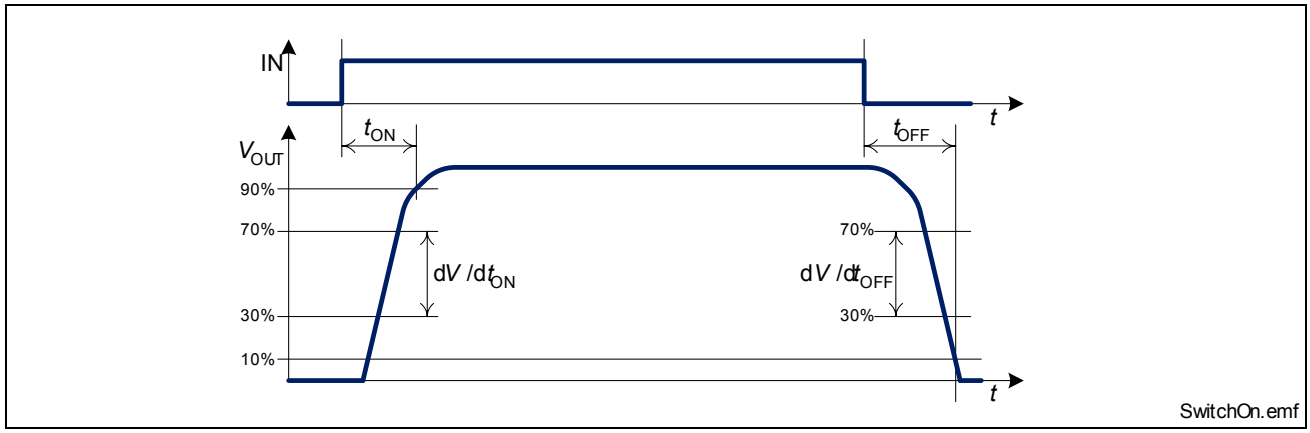

Figure 6 Switching a Load (resistive)

4.1.3 Inductive Output Clamp

When switching off inductive loads with high-side switches, the voltage V_{OUT} drops below ground potential, because the inductance intends to continue driving the current.

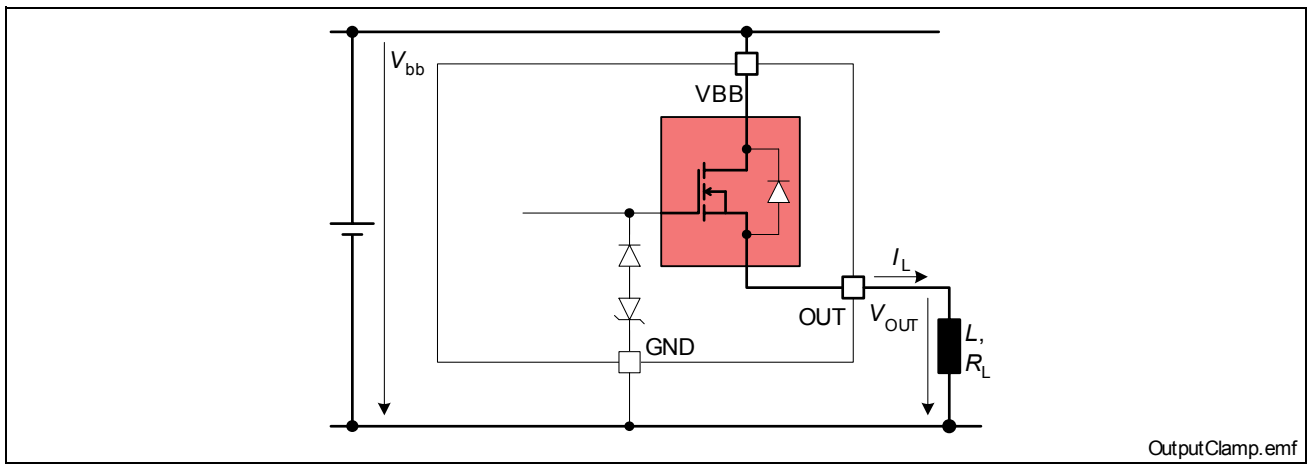

Figure 7 Output Clamp (OUT1 and OUT2)

To prevent destruction of the device, there is a voltage clamp mechanism implemented that keeps that negative output voltage at a certain level ($V_{OUT(CL)}$). See **Figure 7** and **Figure 8** for details. Nevertheless, the maximum allowed load inductance is limited.

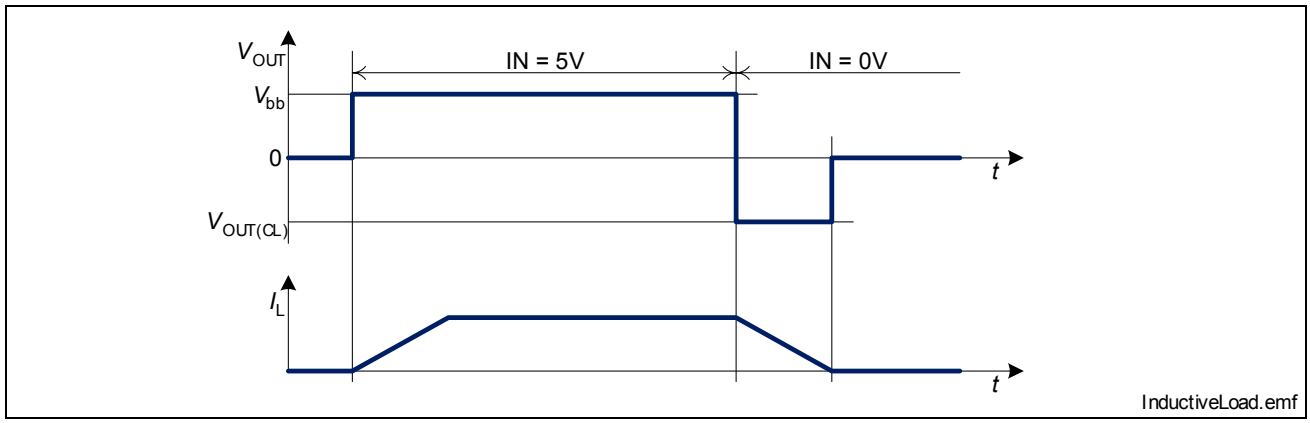

Figure 8 Switching an Inductance

Maximum Load Inductance

While demagnetization of inductive loads, energy has to be dissipated in the BTS 5234L. This energy can be calculated with following equation:

$$E = (V_{bb} + |V_{OUT(CL)}|) \cdot \left[\frac{|V_{OUT(CL)}|}{R_L} \cdot \ln\left(1 + \frac{R_L \cdot I_L}{|V_{OUT(CL)}|}\right) + I_L \right] \cdot \frac{L}{R_L}$$

Following equation simplifies under the assumption of $R_L = 0$:

$$E = \frac{1}{2} L I_L^2 \cdot \left(1 + \frac{V_{bb}}{|V_{OUT(CL)}|}\right)$$

The energy, which is converted into heat, is limited by the thermal design of the component. See **Figure 9** for the maximum allowed energy dissipation.

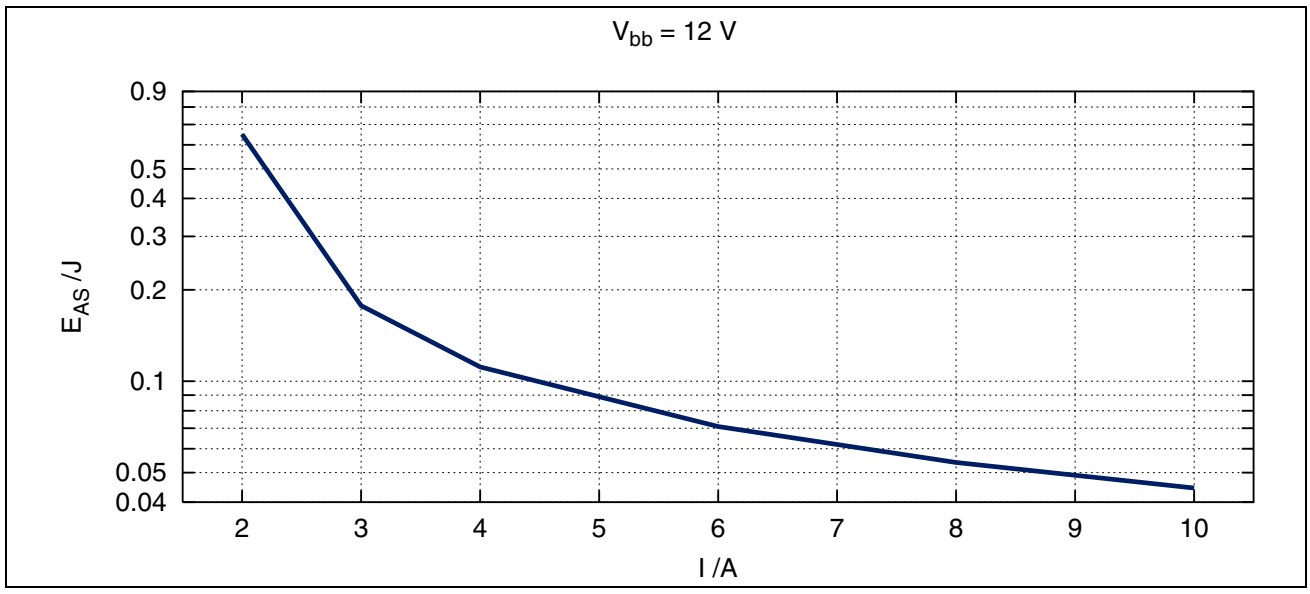

Figure 9 Maximum energy dissipation single pulse, $T_{j,Start}$ = 150°C

4.1.4 Electrical Characteristics

Unless otherwise specified:
V_{bb} = 9 V to 16 V, T_j = -40 °C to +150 °C, typical values: V_{bb} = 13.5 V, T_j = 25 °C

[1] Not subject to production test, specified by design

[2] Device mounted on PCB (50 mm x 50 mm x 1.5mm epoxy, FR4) with 6 cm^2 copper heatsinking area (one layer, 70 µm thick) for V_{bb} connection. PCB is vertical without blown air.

[3] Not subject to production test, parameters are calculated from $R_{DS(ON)}$ and R_{th}

Note: Characteristics show the deviation of parameter at the given supply voltage and junction temperature. Typical values show the typical parameters expected from manufacturing.

4.2 Protection Functions

The device provides embedded protective functions. Integrated protection functions are designed to prevent IC destruction under fault conditions described in the data sheet. Fault conditions are considered as “outside” normal operating range. Protection functions are neither designed for continuous nor repetitive operation.

4.2.1 Over Load Protection

The load current I_{OUT} is limited by the device itself in case of over load or short circuit to ground. There are three steps of current limitation which are selected automatically depending on the voltage V_{DS} across the power DMOS. Please note that the voltage at the OUT pin is V_{bb} - V_{DS}. Please refer to following figure for details.

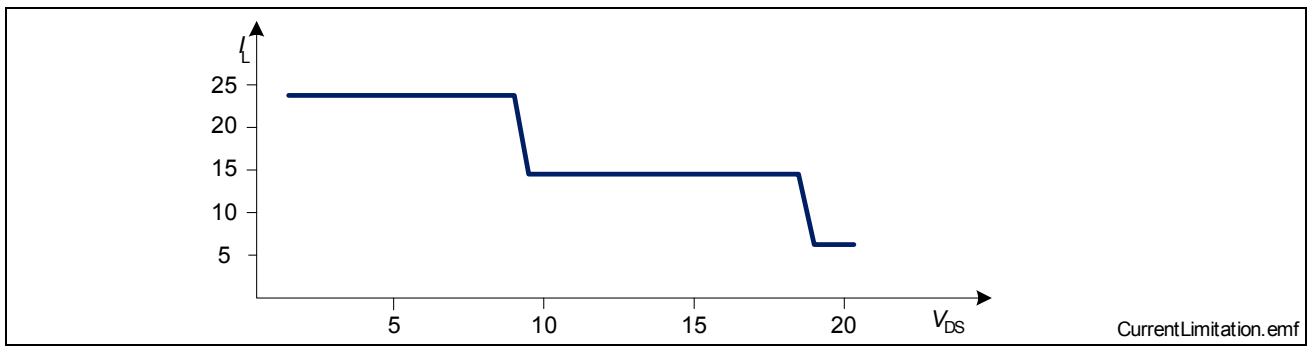

Figure 10 Current Limitation (minimum values)

Current limitation is realized by increasing the resistance of the device which leads to rapid temperature rise inside. A temperature sensor for each channel causes an overheated channel to switch off to prevent destruction. After cooling down with thermal hysteresis, the channel switches on again. Please refer to **Figure 11** for details.

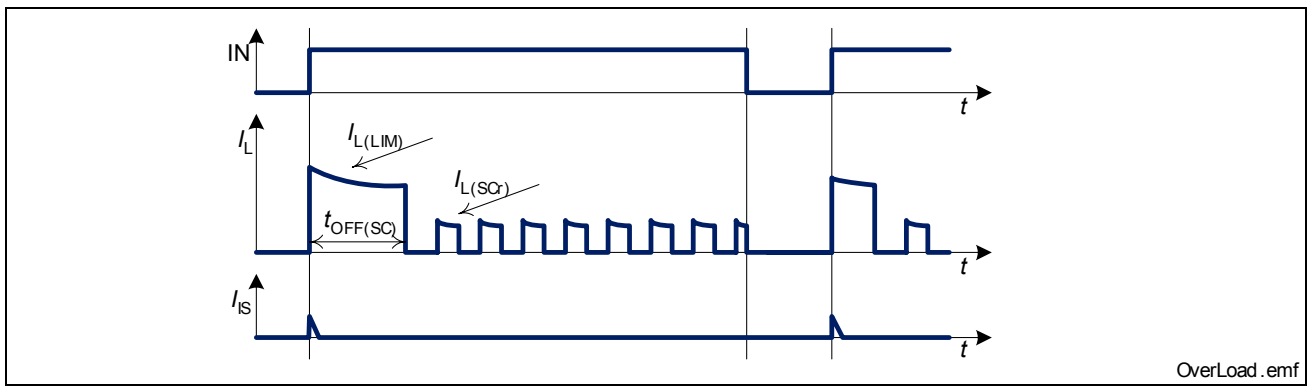

Figure 11 Shut Down by Over Temperature with Current Limitation

In short circuit condition, the load current is initially limited to $I_{L(LIM)}$. After thermal restart, the current limitation level is reduced to $I_{L(SCr)}$. The current limitation level is reset to $I_{L(LIM)}$ by switching off the device (V_{IN} = 0 V).

4.2.2 Reverse Polarity Protection

In case of reverse polarity, the intrinsic body diode causes power dissipation. Additional power is dissipated by the integrated ground resistor. Use following formula for estimation of total power dissipation $P_{diss(rev)}$ in reverse polarity mode.

$$P_{diss(rev)} = \sum_{\text{all channels}} (V_{DS(rev)} \cdot I_L) + \frac{V_{bb}^2}{R_{GND}}$$

The reverse current through the intrinsic body diode has to be limited by the connected load. The current through sense pins IS1 and IS2 has to be limited (please refer to maximum ratings on **Page 8**). The current through the ground pin (GND) is limited internally by R_{GND}. The over-temperature protection is not active during reverse polarity.

4.2.3 Over Voltage Protection

In addition to the output clamp for inductive loads as described in **Section 4.1.3**, there is a clamp mechanism for over voltage protection. Because of the integrated ground resistor, over voltage protection does not require external components.

As shown in **Figure 12**, in case of supply voltages greater than $V_{bb(AZ)}$, the power transistor switches on and the voltage across logic part is clamped. As a result, the internal ground potential rises to V_{bb} - $V_{bb(AZ)}$. Due to the ESD zener diodes, the potential at pin IN1, IN2 and SEN rises almost to that potential, depending on the impedance of the connected circuitry.

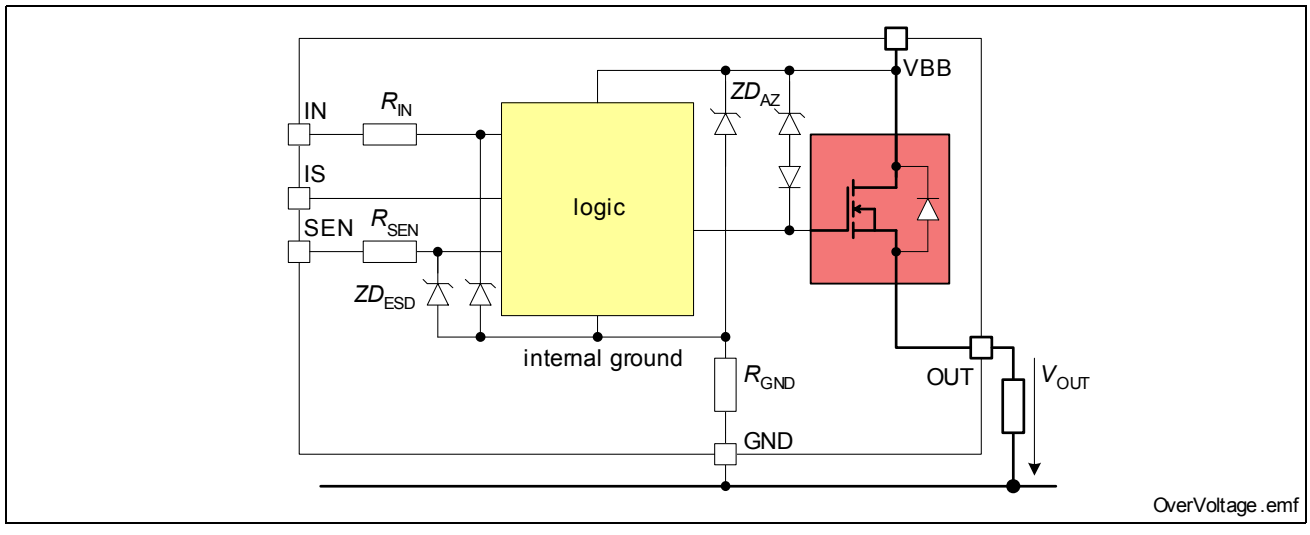

Figure 12 Over Voltage Protection

4.2.4 Loss of Ground Protection

In case of complete loss of the device ground connections, but connected load ground, the BTS 5234L securely changes to or keeps in off state.

4.2.5 Electrical Characteristics

Unless otherwise specified:
V_{bb} = 9 V to 16 V, T_j = -40 °C to +150 °C , typical values: V_{bb} = 13.5 V, T_j = 25 °C

1) Not subject to production test, specified by design

2) no connection at these pins

4.3 Diagnosis

For diagnosis purpose, the BTS 5234L provides an Enhanced IntelliSense signal at pins IS1 and IS2. This means in detail, the current sense signal I_{IS}, a proportional signal to the load current (ratio $k_{ILIS} = I_L / I_{IS}$), is provided in ON-state as long as no failure mode occurs. In case of open load in OFF-state, the voltage $V_{IS(fault)}$ is fed to the diagnosis pin.

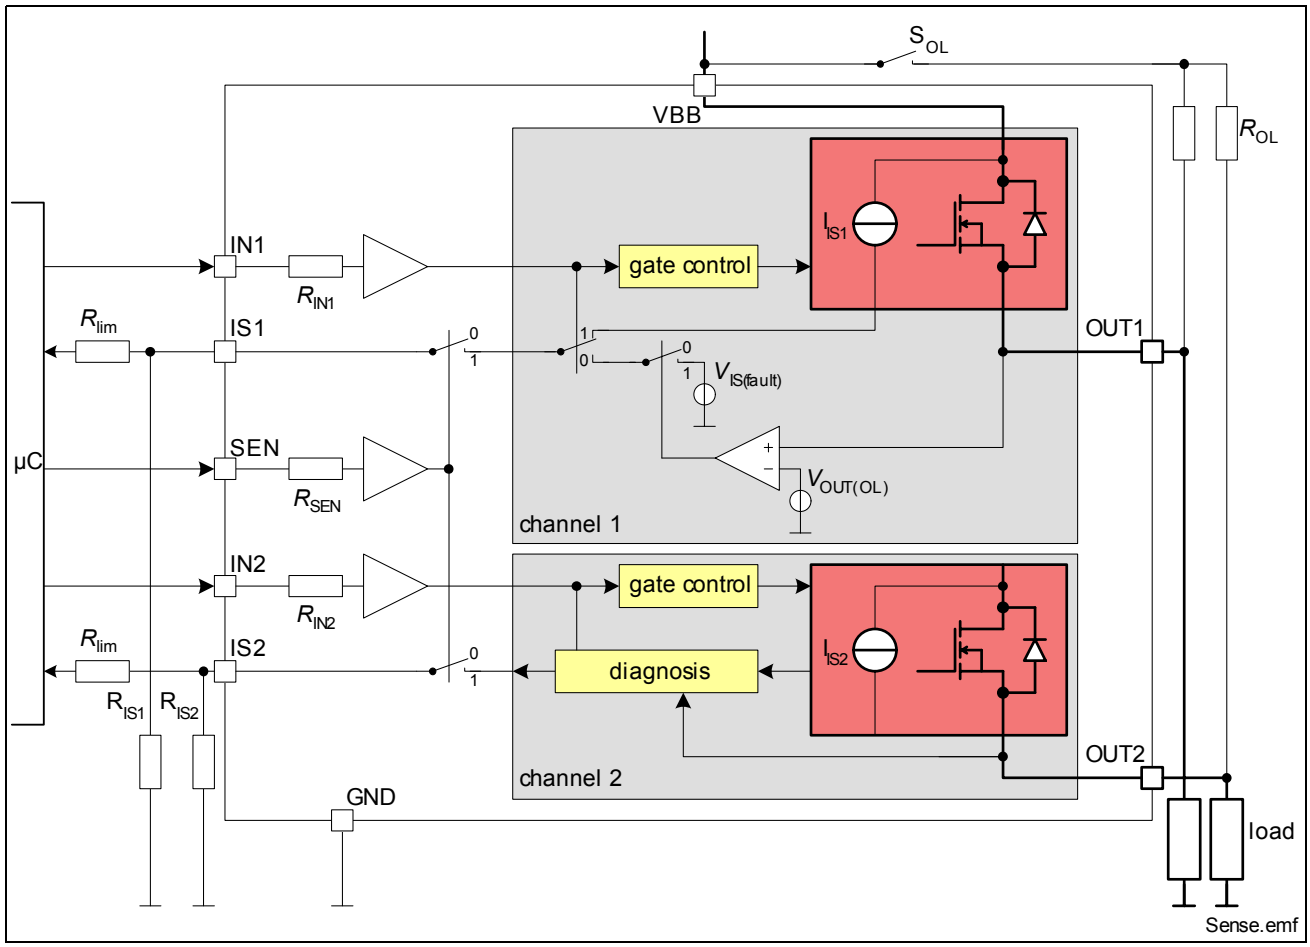

Figure 13 Block Diagram: Diagnosis

Table 1 Truth Table

Operation Mode	Input Level	Output Level	Diagnostic Output	
			SEN = H	SEN = L
Normal Operation (OFF)	L	Z	Z	Z
Short Circuit to GND		Z	Z	Z
Over Temperature		Z	Z	Z
Short Circuit to V_{bb}		V_{bb}	$V_{IS} = V_{IS(fault)}$	Z
Open Load		$< V_{OUT(OL)}$ $> V_{OUT(OL)}$	Z $V_{IS} = V_{IS(fault)}$	Z Z

Table 1 Truth Table

Operation Mode	Input Level	Output Level	Diagnostic Output	
			SEN = H	SEN = L
Normal Operation (ON)	H	$\sim V_{bb}$	$I_{IS} = I_L / k_{ILIS}$	Z
Current Limitation		$< V_{bb}$	Z	Z
Short Circuit to GND		$<< V_{bb}$	Z	Z
Over Temperature		Z	Z	Z
Short Circuit to V_{bb}		V_{bb}	$I_{IS} < I_L / k_{ILIS}$	Z
Open Load		$\sim V_{bb}$	Z	Z

L = Low Level, H = High Level, Z = high impedance, potential depends on leakage currents and external circuit

4.3.1 ON-State Diagnosis

The standard diagnosis signal is a current sense signal proportional to the load current. The accuracy of the ratio ($k_{ILIS} = I_L / I_{IS}$) depends on the temperature. Please refer to following **Figure 14** for details. Usually a resistor R_{IS} is connected to the current sense pin. It is recommended to use sense resistors $R_{IS} > 500\ \Omega$. A typical value is 4.7 kΩ.

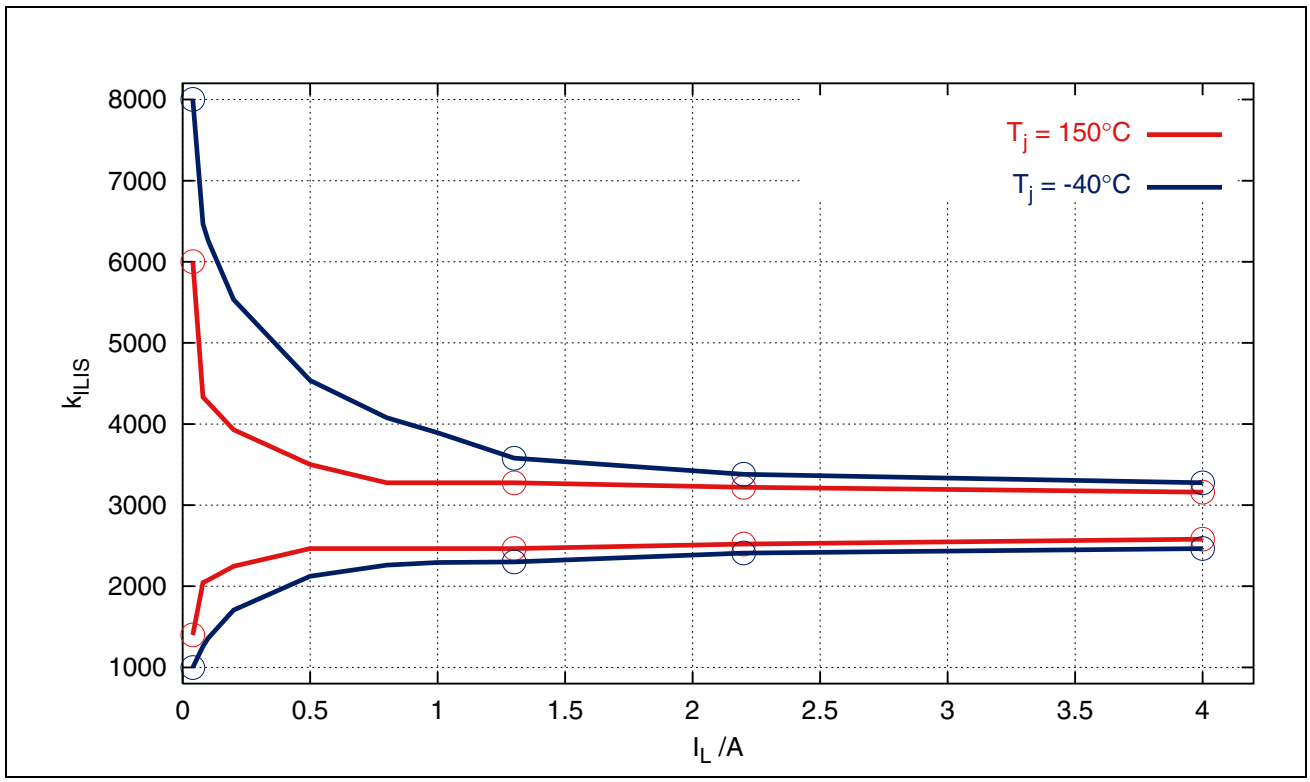

Figure 14 Current sense ratio k_{ILIS} [1)]

1) The curves show the behavior based on characterization data. The marked points are guaranteed in this Data Sheet in **Section 4.3.4** (Position **4.3.6**).

In case of over current as well as over temperature, the current sense signal is switched off. As a result, one threshold is enough to distinguish between normal and faulty operation. Open load and over load can be differentiated by switching off the channel and using open load detection in off-state.

Details about timings between the diagnosis signal I_{IS} and the output voltage V_{OUT} and load current I_L in ON-state can be found in **Figure 15**.

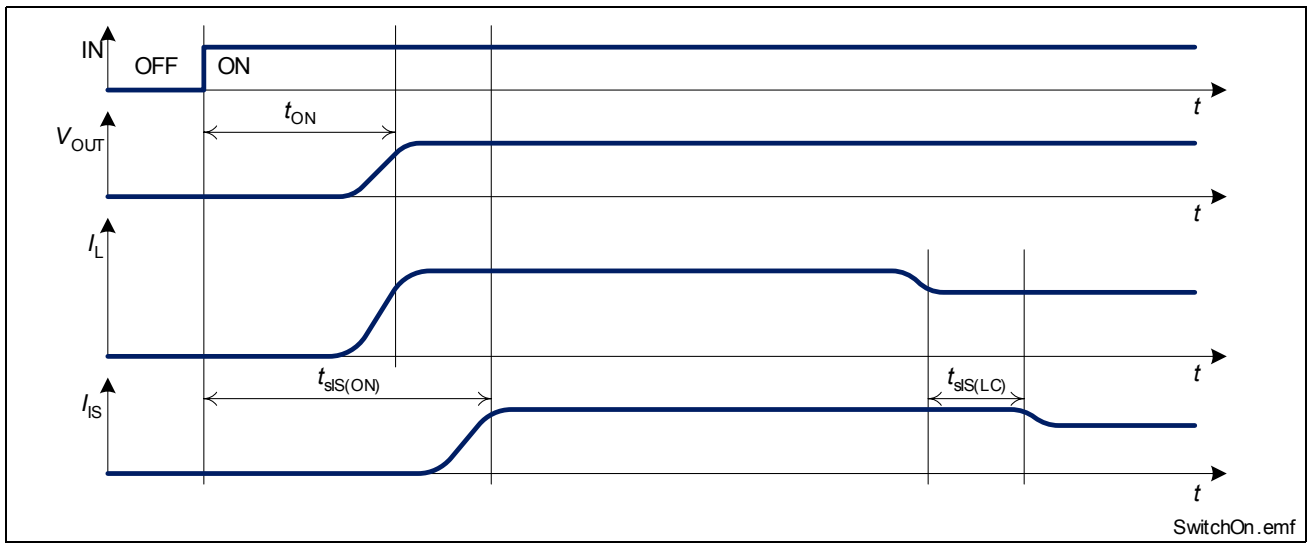

Figure 15 Timing of Diagnosis Signal in ON-state

4.3.2 OFF-State Diagnosis

Details about timings between the diagnosis signal I_{IS} and the output voltage V_{OUT} and load current I_L in OFF-state can be found in **Figure 16**.

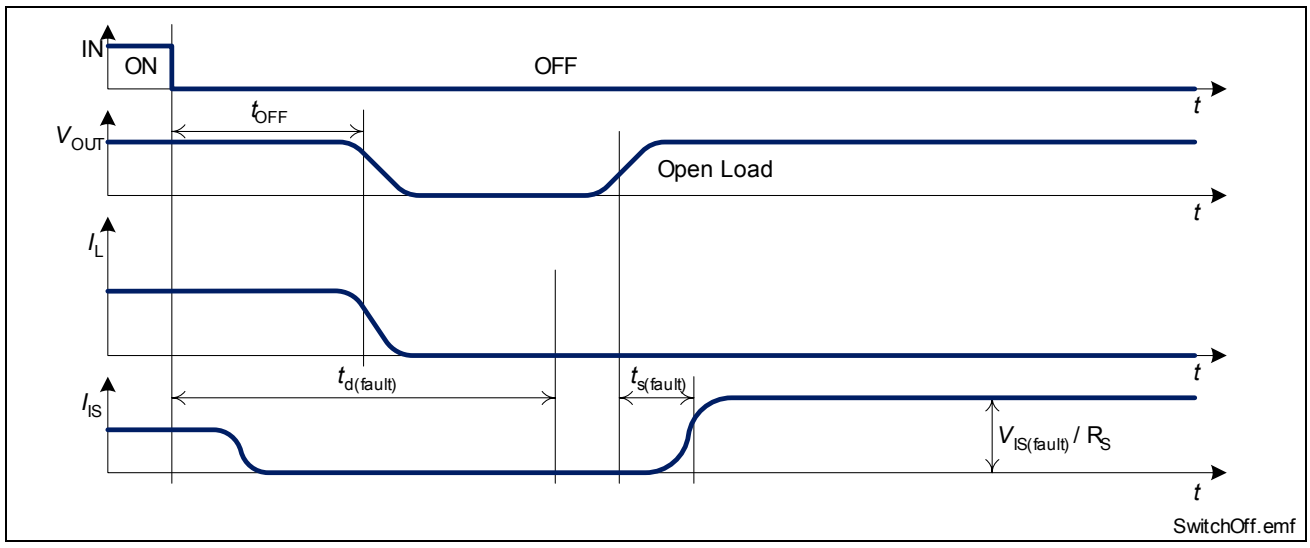

Figure 16 Timing of Diagnosis Signal in OFF-state

For open load diagnosis in off state an external output pull-up resistor (R_{OL}) is recommended. For calculation of the pull-up resistor, just the external leakage current $I_{leakage}$ and the open load threshold voltage $V_{OUT(OL)}$ has to be taken into account.

$$R_{OL} = \frac{V_{bb(min)} - V_{OUT(OL,max)}}{I_{leakage}}$$

$I_{leakage}$ defines the leakage current in the complete system e.g. caused by humidity. There is no internal leakage current from out to ground at BTS 5234L. $V_{bb(min)}$ is the minimum supply voltage at which the open load diagnosis in off state must be ensured.

To reduce the stand-by current of the system, an open load resistor switch (S_{OL}) is recommended.

4.3.3 Sense Enable Function

The diagnosis signals have to be switched on by a high signal at sense enable pin (SEN). See **Figure 17** for details on the timing between SEN pin and diagnosis signal I_{IS}. Please note that the diagnosis is disabled, when no signal is provided at pin SEN.

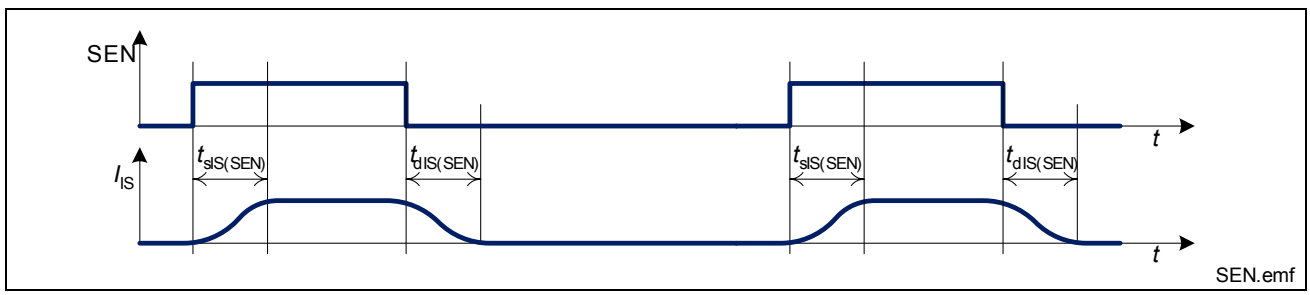

Figure 17 Timing of Sense Enable Signal

The SEN pin circuit is designed equal to the input pin. Please refer to **Figure 5** for details. The resistors R_{lim} are recommended to limit the current through the sense pins IS1 and IS2 in case of reverse polarity and over voltage. Please refer to maximum ratings on **Page 8**.

The stand-by current of the BTS 5234L is minimized, when both input pins (IN1 and IN2) and the sense enable pin (SEN) are on low level.

4.3.4 Electrical Characteristics

Unless otherwise specified:
V_{bb} = 9 V to 16 V, T_j = -40 °C to +150 °C, V_{SEN} = 5 V,
typical values: V_{bb} = 13.5 V, T_j = 25 °C

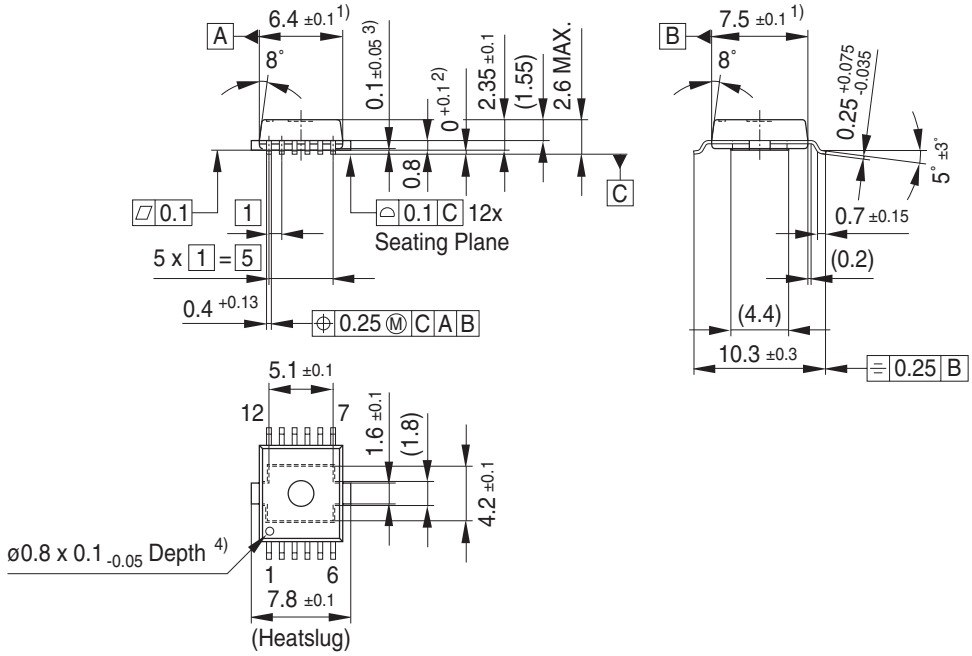
4.3.14	H-input level	$V_{SEN(H)}$	2.5		5.7	V	
4.3.15	L-input current	$I_{SEN(L)}$	3	18	75	µA	V_{SEN} = 0.4 V
4.3.16	H-input current	$I_{SEN(H)}$	10	38	75	µA	V_{SEN} = 5 V
4.3.17	Current sense settling time	$t_{sIS(SEN)}$		3	25	µs	V_{SEN} = 0 V to 5 V V_{IN} = 0 V $V_{OUT} > V_{OUT(OL)}$
4.3.18	Current sense deactivation time	$t_{dIS(SEN)}$			25	µs	V_{SEN} = 5 V to 0 V I_L = 3.5 A R_S = 5 kΩ 1)

1) Not subject to production test, specified by design

5 Package Outlines BTS 5234L

P-DSO-12-2
(Plastic Dual Small Outline Package)



1) Does not include plastic or metal protrusion of 0.15 max. per side
2) Stand OFF
3) Stand OUT
4) Pin 1 Index Marking; Polish finish
All package corners max. R 0.25

You can find all of our packages, sorts of packing and others in our Infineon Internet Page “Products”: http://www.infineon.com/products.

SMD = Surface Mounted Device

Dimensions in mm

Attention please!

The information herein is given to describe certain components and shall not be considered as warranted characteristics.

Terms of delivery and rights to technical change reserved.

We hereby disclaim any and all warranties, including but not limited to warranties of non-infringement, regarding circuits, descriptions and charts stated herein.

Infineon Technologies is an approved CECC manufacturer.

Information

For further information on technology, delivery terms and conditions and prices please contact your nearest Infineon Technologies Office in Germany or our Infineon Technologies Representatives worldwide.

Warnings

Due to technical requirements components may contain dangerous substances. For information on the types in question please contact your nearest Infineon Technologies Office.

Infineon Technologies Components may only be used in life-support devices or systems with the express written approval of Infineon Technologies, if a failure of such components can reasonably be expected to cause the failure of that life-support device or system, or to affect the safety or effectiveness of that device or system. Life support devices or systems are intended to be implanted in the human body, or to support and/or maintain and sustain and/or protect human life. If they fail, it is reasonable to assume that the health of the user or other persons may be endangered.

ENTEGRECİ

Bu belge www.entegreci.com üzerinden sunulmaktadır.

Elektronik komponent tedarikinde Entegreci

Entegreci, Eskişehir merkezli, Türkiye geneline satış yapan bir elektronik komponent mağazasıdır. Entegreler (IC), mikrodenetleyiciler, transistörler, diyotlar, pasif elemanlar, konnektörler, modüller ve geliştirme kartları tek adetten seri üretim adetlerine kadar satılır. Ürün sayfalarında güncel stok durumunu, fiyatı ve datasheet bağlantısını bulabilirsiniz.

Parça koduyla arama

Üretici parça numarasını yazın; stok ve fiyatı hemen görün.
