10) Requires a 150 Ω resistor in GND connection. The reverse load current through the intrinsic drain-source diode has to be limited by the connected load. Note that the power dissipation is higher compared to normal operating conditions due to the voltage drop across the intrinsic drain-source diode. The temperature protection is not active during reverse current operation! Input and Status currents have to be limited (see max. ratings page 3 and circuit page 8).

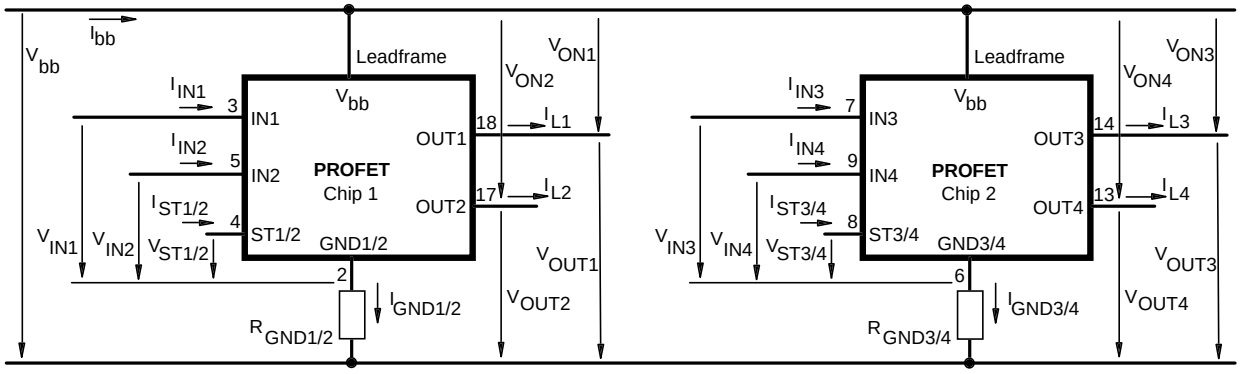
H = "High" Level Status signal valid after the time delay shown in the timing diagrams

Parallel switching of channel 1 and 2 (also channel 3 and 4) is easily possible by connecting the inputs and outputs in parallel (see truth table). If switching channel 1 to 4 in parallel, the status outputs ST1/2 and ST3/4 have to be configured as a 'Wired OR' function with a single pull-up resistor.

Terms

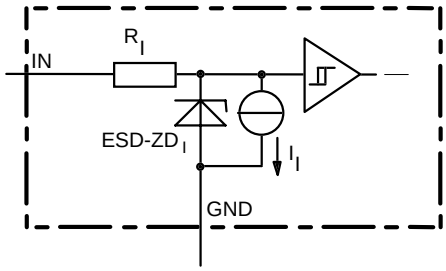


Leadframe (V_{bb}) is connected to pin 1,10,11,12,15,16,19,20
External R_{GND} optional; two resistors $R_{GND1/2}$,$R_{GND3/4}$ = 150 Ω or a single resistor R_{GND} = 75 Ω for reverse battery protection up to the max. operating voltage.

---

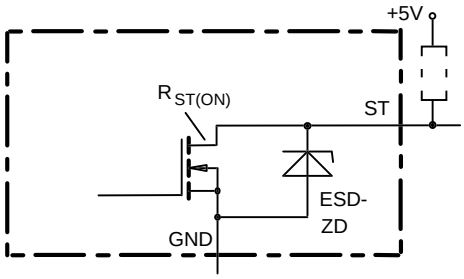
13) With additional external pull up resistor
14) An external short of output to V_{bb} in the off state causes an internal current from output to ground. If R_{GND} is used, an offset voltage at the GND and ST pins will occur and the $V_{ST\ low}$ signal may be errorious.
15) Low resistance to V_{bb} may be detected by no-load-detection

Input circuit (ESD protection), IN1...4



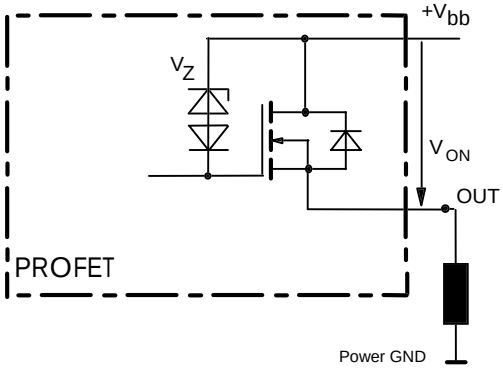
ESD zener diodes are not to be used as voltage clamp at DC conditions. Operation in this mode may result in a drift of the zener voltage (increase of up to 1 V).

Status output, ST1/2 or ST3/4



ESD-Zener diode: 6.1 V typ., max 5.0 mA; $R_{ST(ON)}$ < 380 Ω at 1.6 mA, ESD zener diodes are not to be used as voltage clamp at DC conditions. Operation in this mode may result in a drift of the zener voltage (increase of up to 1 V).

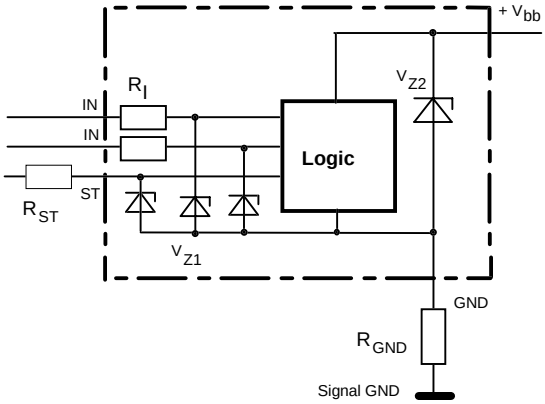
overvoltage output clamp, OUT1...4



V_{ON} clamped to $V_{ON(CL)}$ = 47 V typ.

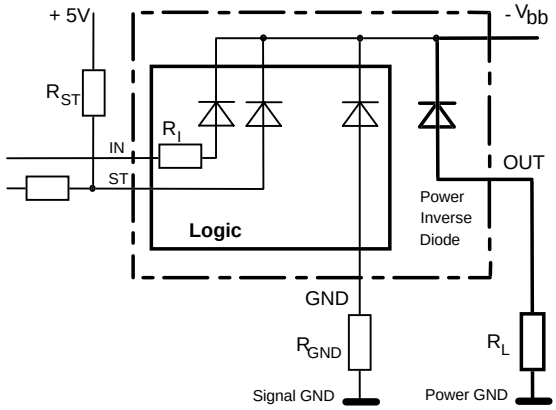
Overvoltage protection of logic part

GND1/2 or GND3/4



V_{Z1} = 6.1 V typ., V_{Z2} = 47 V typ., R_I = 3.5 kΩ typ., R_{GND} = 150 Ω

Reverse battery protection



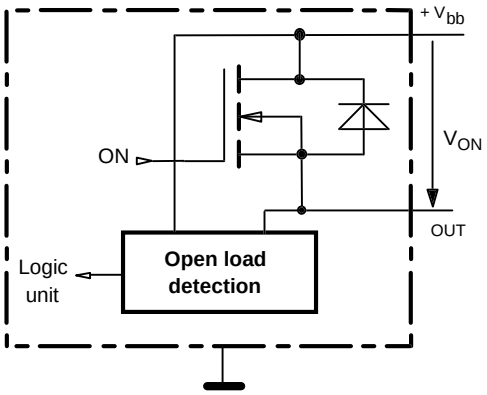
R_{GND} = 150 Ω, R_I = 3.5 kΩ typ,

Temperature protection is not active during inverse current operation.

Open-load detection, OUT1...4

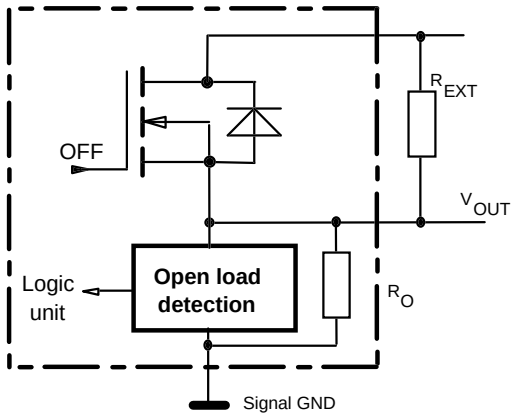
ON-state diagnostic condition:

$V_{ON} < R_{ON} \cdot I_{L(OL)}$; IN high



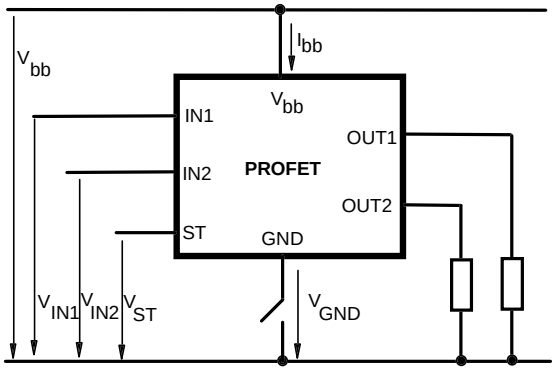
OFF-state diagnostic condition:

$V_{OUT} > 3$ V typ.; IN low



GND disconnect

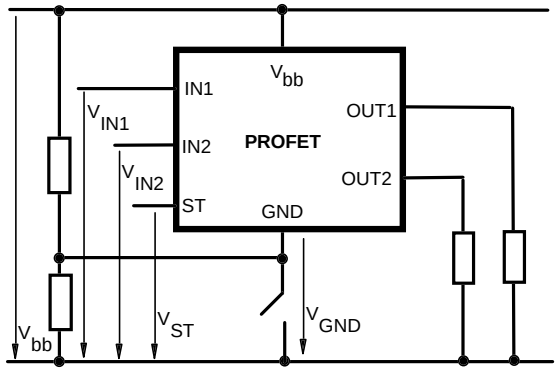
(channel 1/2 or 3/4)



In case of IN = high is $V_{OUT} \approx V_{IN} - V_{IN(T+)}$. Due to $V_{GND} > 0$, no V_{ST} = low signal available.

GND disconnect with GND pull up

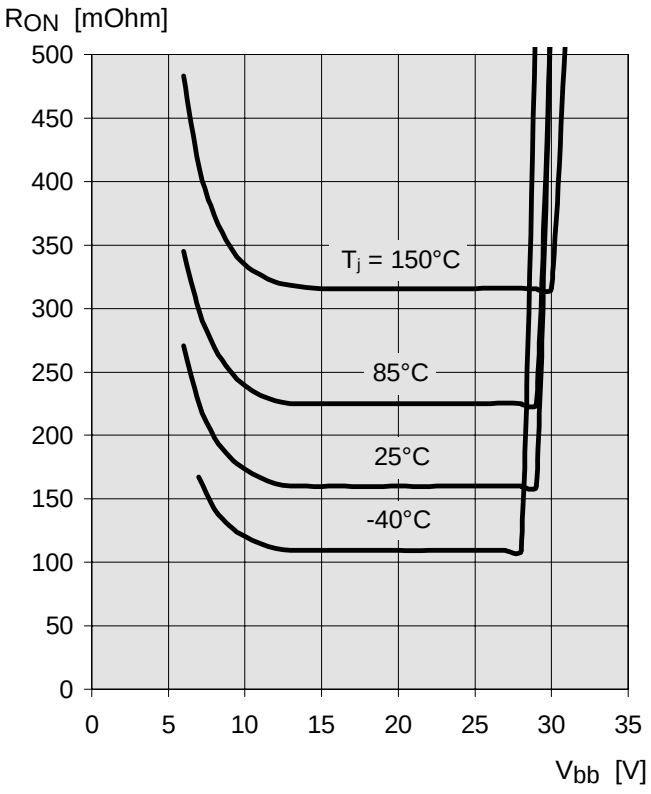
(channel 1/2 or 3/4)



If $V_{GND} > V_{IN} - V_{IN(T+)}$ device stays off
Due to $V_{GND} > 0$, no V_{ST} = low signal available.

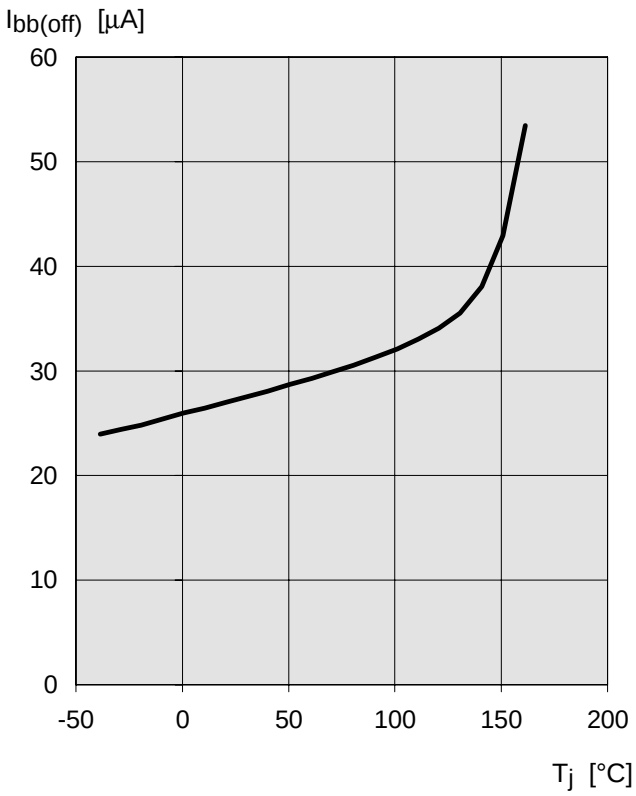
Typ. on-state resistance

$R_{ON} = f(V_{bb}, T_j)$; I_L = 1.8 A, IN = high



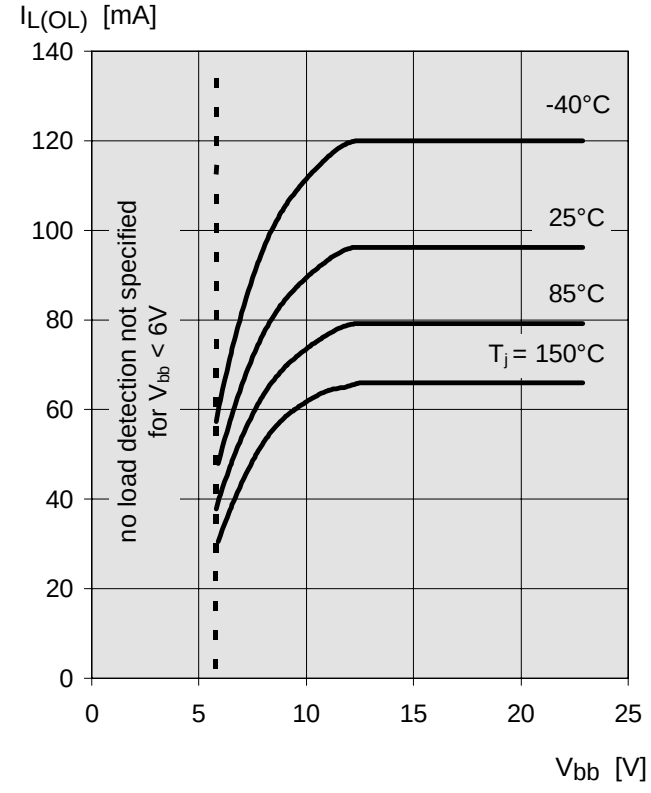
Typ. standby current

$I_{bb(off)} = f(T_j)$; V_{bb} = 9...24 V, $IN_{1...4}$ = low



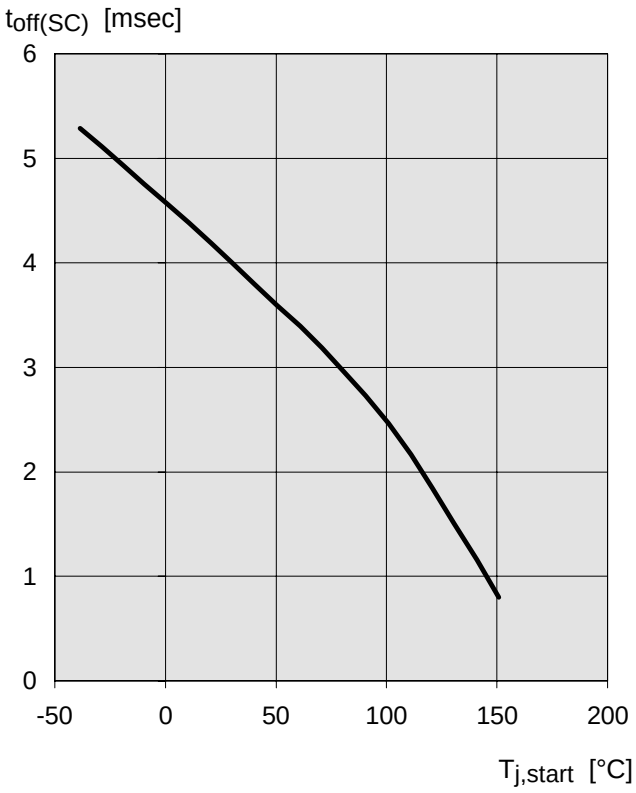
Typ. open load detection current

$I_{L(OL)} = f(V_{bb}, T_j)$; IN = high



Typ. initial short circuit shutdown time

$t_{off(SC)} = f(T_{j,start})$; V_{bb} =12 V



Timing diagrams

Timing diagrams are shown for chip 1 (channel 1/2). For chip 2 (channel 3/4) the diagrams are valid too. The channels 1 and 2, respectively 3 and 4, are symmetric and consequently the diagrams are valid for each channel as well as for permuted channels

Figure 1a: V_{bb} turn on:

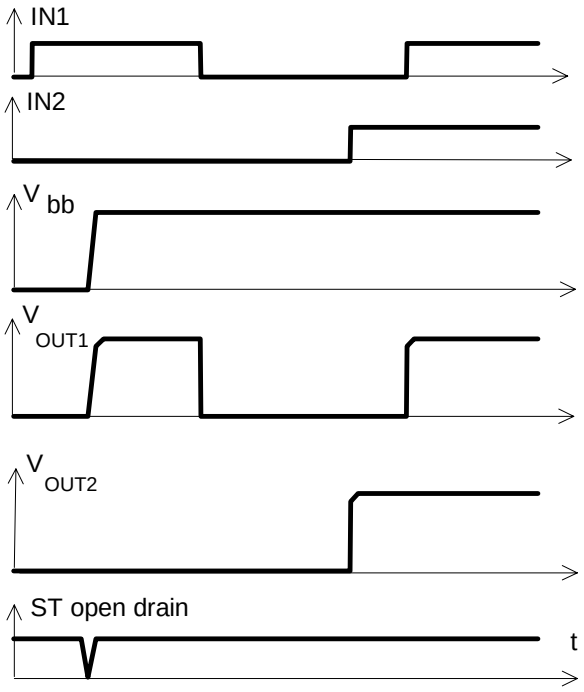


Figure 2a: Switching a lamp:

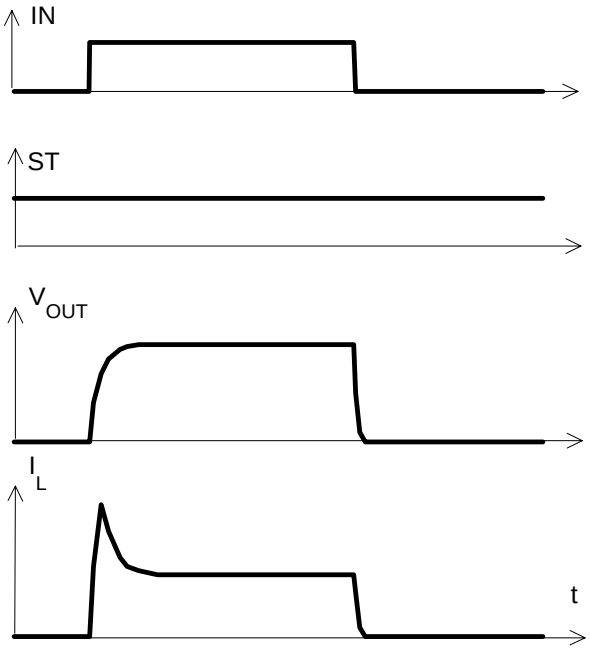
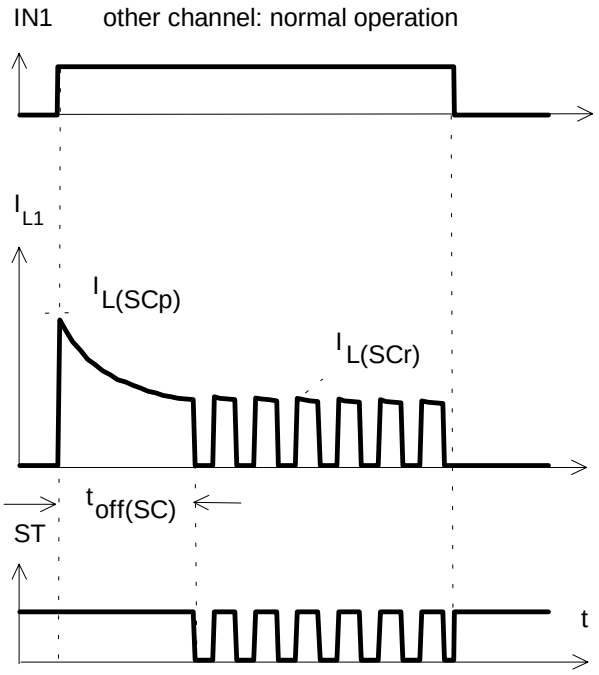


The initial peak current should be limited by the lamp and not by the initial short circuit current $I_{L(SCp)}$ = 9 A typ. of the device.

Figure 3a: Turn on into short circuit:
shut down by overtemperature, restart by cooling



Heating up of the chip may require several milliseconds, depending on external conditions ($t_{off(SC)}$ vs. $T_{j,start}$ see page 10)

shut down by overtemperature, restart by cooling
(two parallel switched channels 1 and 2)

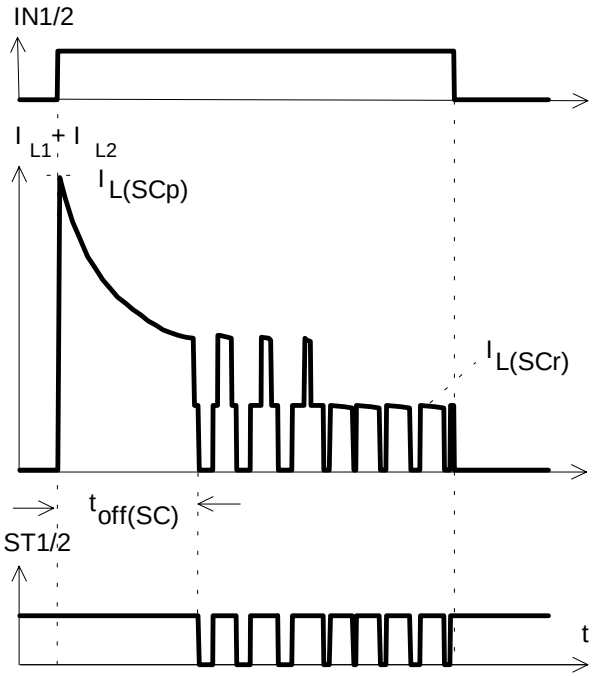

Figure 4a: Overtemperature:
Reset if $T_j < T_{jt}$

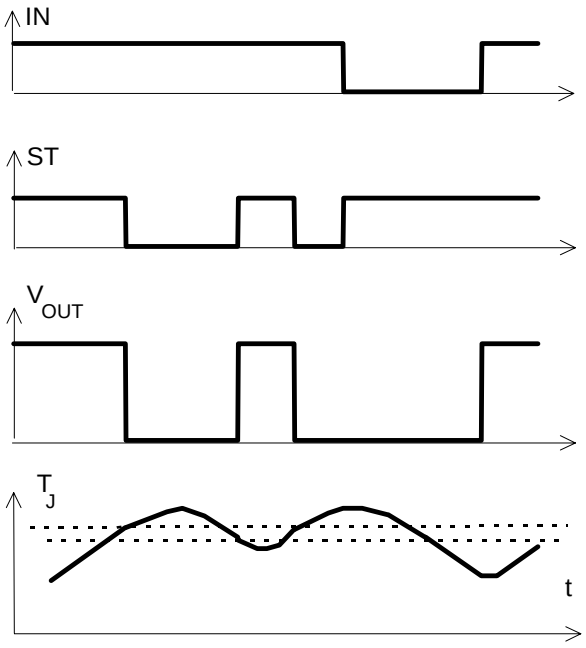

Figure 5a: Open load: detection in ON-state, open load occurs in on-state

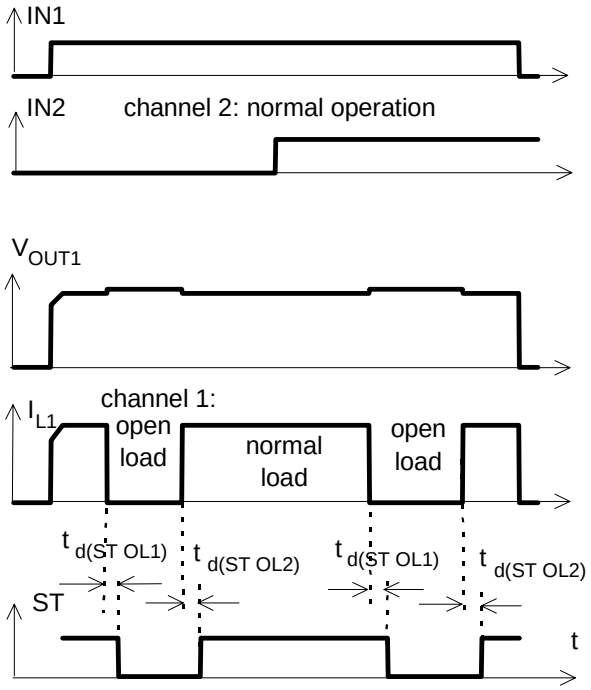
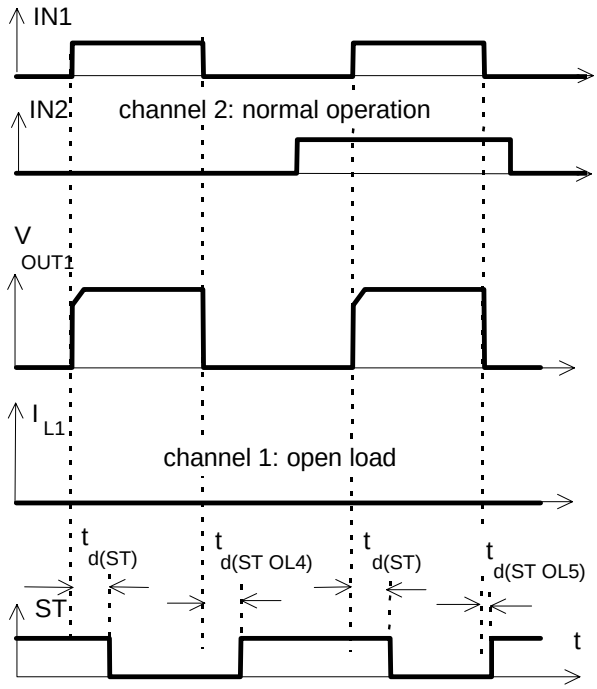


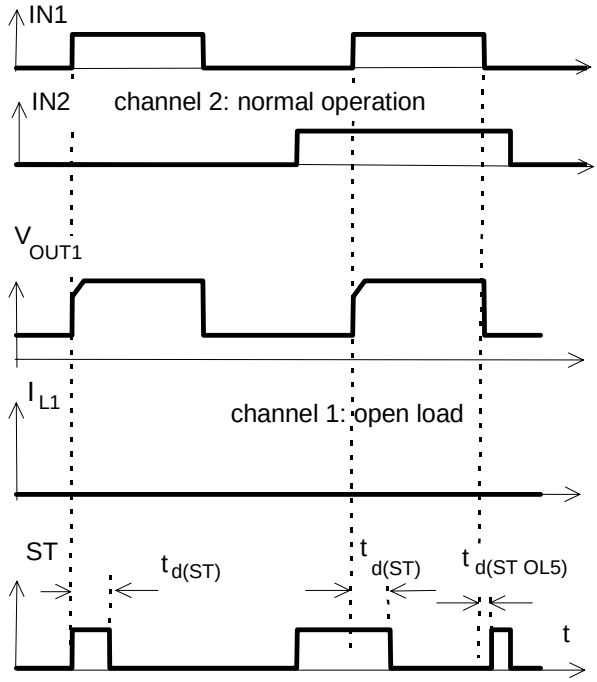
$t_{d(ST\ OL1)}$ = 30 µs typ., $t_{d(ST\ OL2)}$ = 20 µs typ

Figure 5b: Open load: detection in ON-state, turn on/off to open load



The status delay time $t_{d(STOL4)}$ allows to distinguish between the failure modes "open load in ON-state" and "overtemperature".

Figure 5c: Open load: detection in ON- and OFF-state (with R_{EXT}), turn on/off to open load



$t_{d(ST\ OL5)}$ depends on external circuitry because of high impedance

Charge pump starts at $V_{bb(ucp)}$ = 5.6 V typ.
